

***"I've gotta say, I'm loving the product!"***

Our customers are protecting hospital patient records, financial reports, proprietary design files, and even military data.

**They love FileSure because it stops file loss or theft without stopping work.**

*With FileSure, you can still provide access to files while blocking the users' ability to steal them.*

**Many say they've compared FileSure to other security solutions and were blown away:**

- FileSure not only audits and reports file accesses *but can stop unauthorized accesses before they happen.*
- FileSure is more secure than signature-based security *which can be outwitted by encryption or out-maneuvered by secure FTP.*
- FileSure not only blocks file copies to USB drives *but also protects against loss via webmail, IM, secure FTP, and more.*
- FileSure is installed and working in under 5 minutes with a proprietary, alter-proof database. *No consultants, external databases, or steep learning curves.*

**FileSure lets you choose your level of security:**

- Use it for simplified compliance with HIPAA, Sarbanes-Oxley, and more.
- Use threshold alerts to be notified of suspicious behavior as it occurs.
- Deploy FileSure on workstations as well as servers and still regulate file activity centrally.
- Allow broad access to files but disable the ability to copy, move, or delete files.
- Or, just lock down file access completely by criteria you choose.

**No other product offers our noise-free auditing and reporting or our patent-pending security technology—let alone both together in one solution:  
FileSure.**

**All this at less cost than the others . . . and so unbelievably easy to use.**
